EBD: Database Specification Component

Providing the end-user with a **simple**, **quick** and **effective** way to host and control their events, along with allowing participants to easily find information about every aspect of the events they're enrolled in, or simply interested in possibly participating, **is our main goal**.

A4: Conceptual Data Model

With this artifact, we seek to outline the structure and organization of the data to be held within the Event Pointer Project's database.

1. Class diagram

The following diagram (Figure 1) presents the UML with all entities as well as the relationships (including multiplicity) between them, attributes and its constraints for the Event Pointer system.

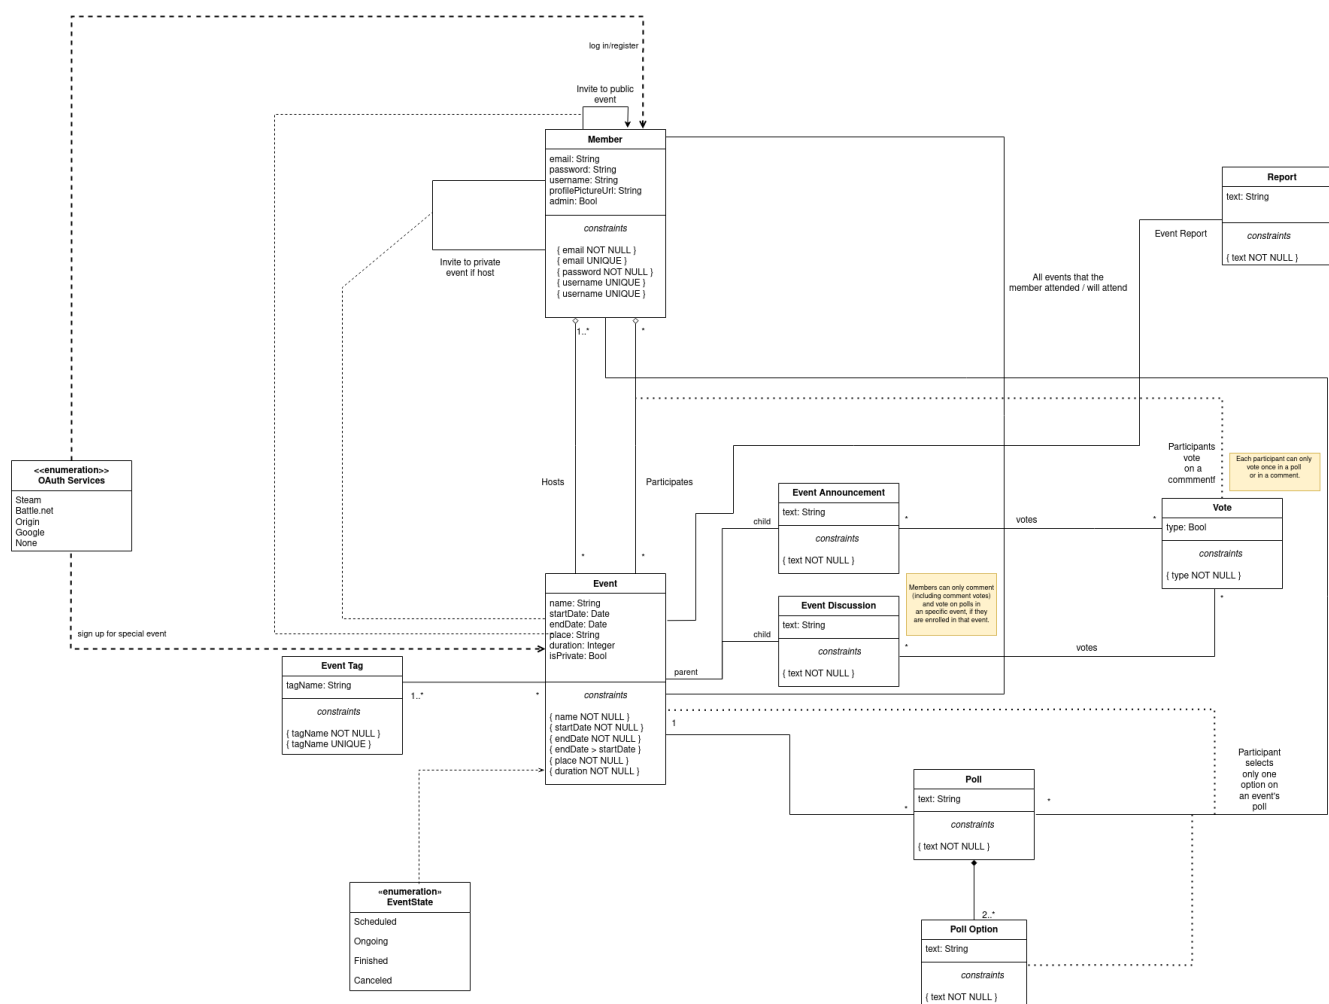

Figure 1: Event Pointer's UML Diagram.

2. Additional Business Rules

- Members can only comment (including comment votes) and vote on polls in a specific event, if they are enrolled in that event.

- Each participant can only vote once in a poll or in a comment.

A5: Relational Schema, validation and schema refinement

This artifact contains the Relational Schema obtained after the conversion of the previous Conceptual Data Model. The Relational Schema includes, for each relation, its own attributes, domains, primary keys, foreign keys and constraints.

1. Relational Schema

The following schema includes, for each relation, attributes, domains, primary keys, foreign keys and constraints.

Relation reference	Relation Compact Notation
R01	member (**idMember**,username NN UK, email NN UK, password NN, profilePictureURL, isAdmin NN)
R02	event (**idEvent**, name NN, startDate NN, endDate NN, place NN, duration, state NN CK state IN event_state, isPrivate NN, tag -> event_tag)
R03	event_role(**idRole**.idMember -> member, idEvent -> event, isHost)
R04	event_tag (**idTag**, tagName NN UK)
R05	event_announcement (**idMessage**, text NN ,idRole->event_role)
R06	event_comment (**idComment**, text NN, idRole->event_role)
R07	event_poll (**idPoll**, text NN, idRole->event_role)
R08	poll_option (**idOption**, idPoll->poll, text NN)
R09	vote (**idVote**, type NN, idParticipant->EventRole, idComment->event_comment, idAnnouncement->event_announcement) CK ((idAnnouncement IS NOT NULL AND idComment IS NULL) OR (idAnnouncement IS NULL AND idComment IS NOT NULL))
R10	report (**idReport**, idEvent -> event)

Legend:

- UNIQUE KEY = UK
- NOT NULL = NN
- CK = CHECK

2. Domains

The specification of additional domains can also be made in a compact form, using the notation:

Domain Name	Domain Specification
Today	DATE DEFAULT CURRENT_DATE

Domain Name	Domain Specification
EventState	ENUM ('Scheduled', 'Ongoing', 'Finished', 'Canceled')

3. Schema validation

In order to validate the previous Relational Schema, all functional dependencies are identified as well as the normalization of all relation schemas.

TABLE R01	(member)
Keys	{ idMember }, { username }, { email }
Functional Dependencies:	
FD0101	idMember → {username, email, password, profilePictureURL, isAdmin}
FD0102	email → {idMember, username, password, profilePictureURL, isAdmin}
FD0103	username → {idMember, email, password, profilePictureURL, isAdmin}
Normal Form	BCNF

TABLE R02	(event)
Keys	{ idEvent }
Functional Dependencies:	
FD0201	idEvent → {name, startDate, endDate, place, duration, state, isPrivate, tag}
Normal Form	BCNF

TABLE R03	(event_role)
Keys	{ idRole } }
Functional Dependencies:	
FD301	idRole → {idMember,idEvent,isHost}
Normal Form	BCNF

TABLE R04	(event_tag)
Keys	{ idTag }, { tagName }
Functional Dependencies:	
FD0401	idTag → {tagName}
FD0402	tagName → {idTag}
Normal Form	BCNF

TABLE R05	(event_announcement
Keys	{ idMessage }

TABLE R05	(event_announcement
Functional Dependencies:	
FD0501	idMessage → {text, idRole}
Normal Form	BCNF

TABLE R06	(event_comment)
Keys	{ idComment }
Functional Dependencies:	
FD0601	idComment → {text, idRole}
Normal Form	BCNF

TABLE R07	(event_poll)
Keys	{ idPoll }
Functional Dependencies:	
FD0701	idPoll → {text, idRole}
Normal Form	BCNF

TABLE R08	(poll_option)
Keys	{ idOption }
Functional Dependencies:	
FD0801	idPoll → {text, idEvent}
Normal Form	BCNF

TABLE R09	(vote)
Keys	{ idVote }
Functional Dependencies:	
FD0901	idVote → {type, idParticipant, idComment, idAnnouncement}
Normal Form	BCNF

TABLE R010	(report)
Keys	{ idReport }
Functional Dependencies:	
FD1001	idReport → {idEvent}
Normal Form	BCNF

A6: Indexes, triggers, transactions and database population

This artefact contains the database's workload with a study of the predicted system load (database load) as wells as the physical schema of the Event Pointer database, the identification and characterisation of the indexes, triggers, for data integrity rules support, and the definition of the database user-defined functions.

This artefact also presents the transactions needed to assure the data integrity in the presence of concurrent accesses, with their own isolation level which is explicitly stated and justified. Finally a complete database creation script, including all SQL necessary to define all integrity constraints, indexes and triggers and includes a separate script with INSERT statements to populate the database.

1. Database Workload

Relation reference	Relation Name	Order of magnitude	Estimated growth
R01	member	10 k	10 / day
R02	event	100	1 / day
R03	event_role	1 k	10 / day
R04	event_tag	10	none
R05	event_announcement	100	1 / day
R06	event_comment	1 k	10 / day
R07	event_poll	1 k	10 / day
R08	poll_option	100	1 / day
R09	vote	1 k	10 / day
R10	report	100	1 / day

2. Proposed Indices

2.1. Performance Indices

Index	IDX01
Relation	event
Attribute	state
Type	Hash
Cardinality	low
Clustering	No
Justification	Table 'event' is frequently accessed to obtain event's information. After analysing possible indexes 'state' was the most interesting since obtaining all events in a specific state is a frequent request .
SQL code	CREATE INDEX event_state ON event USING hash (state);
Index	IDX02

Index	**IDX02**
Relation	event
Attribute	enddate
Type	B-tree
Cardinality	low
Clustering	No
Justification	Table 'event' is frequently accessed to filter the events by date. A b-tree index will provide faster date range queries based on the event's end date.
SQL code	CREATE INDEX end_event ON event USING btree (enddate);
Index	**IDX03**
Relation	event
Attribute	startdate
Type	B-tree
Cardinality	low
Clustering	No
Justification	Table 'event' is frequently accessed to filter the events by date. A b-tree index will provide faster date range queries based on the event's start date.
SQL code	CREATE INDEX start_event ON event USING btree (startdate);

2.2. Full-text Search Indices

> The system being developed must provide full-text search features supported by PostgreSQL. Thus, it is necessary to specify the fields where full-text search will be available and the associated setup, namely all necessary configurations, indexes definitions and other relevant details. | **Index** | IDX01 | |----------|-------| | **Relation** | Relation where the index is applied | | **Attribute** | Attribute where the index is applied | | **Type** | B-tree, Hash, GiST or GIN | | **Clustering** | Clustering of the index | | **Justification** | Justification for the proposed index | | SQL code | |

3. Triggers

> User-defined functions and trigger procedures that add control structures to the SQL language or perform complex computations, are identified and described to be trusted by the database server. Every kind of function (SQL functions, Stored procedures, Trigger procedures) can take base types, composite types, or combinations of these as arguments (parameters). In addition, every kind of function can return a base type or a composite type. Functions can also be defined to return sets of base or composite values. | **Trigger** | TRIGGER01 | |-------------|-----------| | **Description** | Trigger description, including reference to the business rules involved | | SQL code | |

4. Transactions

SQL Reference	Transaction Name
Transaction	TRAN01
Justification	In order to maintain consistency, it's necessary to use a transaction to ensure that a member is safely deleted. If an error occurs nothing happens otherwise the member with that username is deleted.
Isolation level	Isolation level of the transaction.
Complete SQL Code	BEGIN TRANSACTION

```
SELECT COUNT (*) AS member_found FROM member WHERE username= $username
IF member_found = 0
BEGIN
    RETURN ERROR_NOT_FOUND
END
DELETE FROM member WHERE username = $username
```

COMMIT TRANSACTION |

Annex A. SQL Code

> The database scripts are included in this annex to the EBD component.
>
> The database creation script and the population script should be presented as separate elements. The creation script includes the code necessary to build (and rebuild) the database. The population script includes an amount of tuples suitable for testing and with plausible values for the fields of the database.
>
> This code should also be included in the group's git repository and links added here.

A.1. Database schema

```
--PRAGMA FOREIGN_KEYS = ON;

-----------------------------------------
-- Types
-----------------------------------------

Revision history

Changes made to the first submission:

1. Add Project Vision and A4 Intro
2. Add Class Diagram
3. Add Relational Schema and Domains

GROUP2115, 09/11/2021
